

*Dr. Steve Nelson holds PhD in Pharmacology and a PhD in Biochemistry and Clinical Nutrition. Dr. Nelson has 43 years of experience in applied Pharmacology and Biochemistry and over 15 years experience as a Clinical, Naturopathic, and Homeopathic Physician.*

"When you drink alkaline ionized water, you're bathing and feeding the cells... In five years or less, ionizers will not only be an option, but a necessary component in everyday living."

The ionizer produces an OH<sup>-</sup> ion which is the source of oxygen in the water. The higher the ORP, the higher the oxygen retention in the water. The body needs oxygen to function.

It has been shown in the last 15 years, that the atmospheric presence of oxygen has been depleted by 30 percent. People who are ill and are dying of chronic diseases are oxygen starved. It's very difficult to improve the atmosphere, but we can easily improve what people drink.

Ionization and oxygenation are the same when it comes to OH<sup>-</sup> ions. It will sustain life longer and give people energy. Hans Celier proved that infections cannot live in high oxygen environments in the body. Scientist and doctors have shown that the more alkaline you keep yourself, the healthier you're going to be, because you're going to metabolize or break down all the acid by-products of cell respiration. When you start bathing the cells in oxygen-rich water, they are no longer dividing themselves in an acidic and unhealthy environment. The cells begin to divide into new, healthy cells instead of sick cells. By alkalizing the body, you are restoring the body to its normal balance, allowing all systems to function normally.

From a simple dehydration standpoint, virtually 100 percent of my patients are dehydrated, and the more water that is not alkaline ionized water that you drink, the more dehydrated you'll be. Dehydration begets dehydration. When you drink alkaline ionized water, you're bathing and feeding the cells. People forget that water and oxygen are nourishment the cells can't live without. As you continue to oxygenate and alkalize, you start changing your body's environment to one that is more positive and where infections and pathogens cannot survive.
