Prmium Filtration System

- Dual filtration
- Active Carbon Filter (filters rust and dregs, residual chlorine in water, and volatile organic compounds)
- Composite Ceramic Filter (balances ions, adds metabolites and mineralizes water)
- 951 gallon cycle, equivalent to 6 months of use

Active Carbon Filter

Active Carbon Filter captures relatively large suspended matter like rust and dregs, residual chlorine in water, and volatile organic compounds. The properties of matter such as water temperature water and (hydraulic) pressure can be changed according to where to be installed.

Composite Ceramic Filter

Composite Ceramic Filter can be broken down into 3 parts:

1. **M ceramic**: M ceramic keeps the balance of ions. It is an ion ceramic.
2. **P ceramic**: P ceramic has plenty of minerals and dissolves nutrients well to help create electrolytes for the human body. This ceramic can aid the metabolism of the human body.

3. **K ceramic:** K ceramic has plenty of minerals and it helps to keep the water stable.
